Care Tips For Your Foliage Plants

Selecting a Plant

An important key to your success will be to start with a healthy plant. Avoid plants with off color or abnormally yellow foliage and check the undersides of the leaves for signs of pests. Plants that have that "neglected look" are best left.

Light

Your foliage plant will decline very quickly if placed in an area where light intensity is too low. If light intensity is to strong the leaves may sunburn. A few of the more common indoor foliage plants are listed according to their light needs on the back of this sheet.

Low Light Plants - Prefer light levels which normally exist in a northern and/or shaded window. You should be able to read comfortably in the area where the plant will be placed.

Medium Light Plants - Prefer light levels achieved when a plant is within 5-10 feet of a bright sunny window or directly in an east or south facing window that is partially blocked by buildings or trees. Your hand will cast a fuzzy but definite shadow when held over the spot where the plant will be placed.

High Light Plants - Prefer light from an unobstructed east, south, or west window. During the summer months it would be wise to draw a sheer curtain between the plants and the window to prevent sunburn. Your hand will leave a well-defined shadow when placed over the spot you've picked for the plant.

Very High Light Plants - Prefer light levels which provide at least 5 hours of direct sunlight during the winter and 3 hours during the summer. Be careful of excessive heat that may build up in west facing windows.

Watering

Over watering is a very common problem with houseplants. Water only when the plants need watering, not when your calendar says it is time to do so. Your plants will use water at a varying rate depending upon light and temperature conditions and plant size. The best way to check for watering is to touch the soil with your finger. When you do water, apply enough water so that the entire soil mass is moistened and some water drains from the drain holes in the bottom of the container. Never allow your plants to "stand" in water as this may lead to root rot. Finally, use room temperature water, never ice cold or hot, and water the soul, not the leaves. Check the back of this sheet for watering recommendations for a variety of foliage plants.

Temperature

Most foliage plants do well at normal indoor temperatures. If you're comfortable, the plant probably is too. However, watch that the plants are not exposed to cold or hot drafts and avoid excessively warm spots such as the top of your television. Avoid leaving plants on windowsills in extremely cold weather as the foliage may be frozen or chilled.

Care Tips For Your Foliage Plants ...

Humidity

Many homes have very low humidity levels, especially during the winter months. Setting your plants on trays of gravel that have been flooded with water can be very helpful. As the water evaporates into the air, the humidity is significantly increased around the plant. Contrary to popular opinion, misting your plants doesn't do any good. In fact it may do more harm than good my facilitation the spread of foliage diseases.

Fertilizer

Fertilizer residues from the growing cycle in the greenhouse will e sufficient for the first month. You may then begin to fertilize with any house plant fertilizer according to the label directions. Avoid fertilization as winter approaches.

Low Light Plants
